August 5, 1993

The Honorable Edward M. Kennedy
Chairman, Committee on Labor and Human Resources
United States Senate

The Honorable Nancy L. Kassebaum
Ranking Minority Member
Committee on Labor and Human Resources
United States Senate

In response to your August 19, 1992, request and after discussions with your offices, we examined (1) the economic and demographic characteristics of school age children in families and (2) changes in these characteristics between 1980 and 1990. In particular, we focused on national and state profiles of children in families with incomes below the poverty level.¹ You requested this information for the Committee as it considers the reauthorization of Chapter 1 of Title I of the Elementary and Secondary Education Act of 1965 (ESEA). Chapter 1 provides financial assistance for the education of low-achieving children in high poverty areas. We presented our preliminary results in a briefing with your staff on April 6, 1993. Our final results appear in this briefing report, which includes the charts used in that briefing (see app. I).

Results in Brief

Our analysis of decennial census data identified demographic changes that may have important implications for ESEA's Chapter 1 and other education programs targeted toward populations with special needs. For example, the school age population—children aged 5 to 17 in families—declined by 2.3 million during the 1980s. But during this period, the number of poor school age children increased, and—like the total school age population—became more racially and ethnically diverse. The poor school age population increased by about 6 percent to 7.6 million, with the number of poor Hispanic and Asian children² growing at the greatest rates.

Between 1980 and 1990, the poor school age population grew and became more concentrated in the West and Southwest. During this period, the South and East accounted for proportionately fewer of the nation's poor

¹We rely on the definition of poverty status used by the Bureau of the Census and prescribed by the Office of Management and Budget (OMB).

²In this report, we base our designations for race and ethnicity on the 1990 decennial Census question regarding Hispanic origin. The categories "white," "black," "Asian," and "American Indian/other" refer only to non-Hispanic members of those racial groups. All Hispanics—regardless of race—are included in the Hispanic category.

children. However, significant concentrations of school age poor remain in these regions, especially in the South. In 1990, of the 10 states with the highest poverty rates—the percentage of all children who are poor—8 were Southern states.

The poor school age population also increased and became more concentrated in our nation's largest cities. Large cities in the West and Southwest gained poor children while many Eastern and some Southern cities lost them. However, many Southern and Eastern cities maintained very high numbers of poor school age children and substantial school age poverty rates.

With no changes in the Chapter 1 allocation formula, these patterns will substantially affect the distribution of the program's funds to states and counties. Many Western and Southwestern states will gain funds while some states and counties, including those with very high poverty concentrations, are likely to lose funds with the shift to 1990 census data in the Chapter 1 allocation formula.

Other trends we identified have consequences for federal education programs, like the Bilingual Education Act, that support services to other specially targeted child populations. For example, the population of children from immigrant or linguistically isolated (LI)³ households or children with limited English proficiency (LEP)⁴ became more heavily concentrated in a few states and grew substantially during the 1980s.

Background

ESEA is the major federal legislation providing financial assistance to meet the educational needs of the nation's children, specifying 46 programs that provide educational aid. The largest of ESEA's programs is Chapter 1.⁵ Chapter 1 targets financial aid through states to local educational agencies to assist educationally disadvantaged students attending schools with

³These are children reported by the Bureau of the Census as living in families where no person 14 years of age or older speaks English only or speaks English "very well." See appendix II.

⁴In general, children of limited English proficiency are those who have difficulty speaking, reading, writing, or understanding English. We defined as LEP all persons aged 5 to 17 living in families who Census reported as not speaking English only or not speaking English "very well." See appendix II.

⁵Unless we specify otherwise, we use the term Chapter 1 to mean Chapter 1, Part A, which provides basic and concentration grants to local educational agencies. Basic grants are allocated to states, in part, on the basis of their number of poor school age children. Chapter 1 allocations of concentration grants are distributed to states for counties that have high poverty rates or large numbers of poor school age children.

concentrations of low-income students. In fiscal year 1993, the federal government distributed over \$6.1 billion dollars through Chapter 1.⁶

Decennial census data play a critical role in the distribution of resources for ESEA's Chapter 1 and other formula-driven education programs. For example, Chapter 1 funding for basic grants is allocated to states primarily based on the number of poor children residing in their counties. Chapter 1's basic grant allocation formula considers, among other variables, the number of school age children in poverty—persons aged 5 to 17 living in families with incomes below the poverty level—as measured by the Bureau of the Census. Thus, changes in the school age poverty population affect county and therefore total state funding allocations. The Department of Education will use 1990 decennial census data on school age poverty to determine Chapter 1 grants for 1993-94.

As we have reported,⁷ Chapter 1's current allocation formula may underestimate the total number of poverty-related low achieving children. Although the number of poor children correctly estimates the number of low achieving students for most counties, it underestimates the number of low achievers in counties that have large numbers of poor children. Thus, the current funding formula underestimates the funding needs of these counties.

ESEA provides other programs to assist child populations with special needs. Among these are programs for Migratory Children under Chapter 1, Part D, which provides grants to state educational agencies for programs to meet the educational needs of these children. The Emergency Immigrant Education Program under Title IV provides supplementary educational services to immigrant children enrolled in elementary and secondary schools. ESEA's Title VII, the Bilingual Education Act, provides financial assistance to local education agencies to develop bilingual education programs. Funding for these three programs totaled more than \$500 million in fiscal year 1993.⁸ School district officials around the country

⁶For fiscal year 1993, Chapter 1 basic grants totaled over \$5.4 billion, with concentration grants accounting for almost \$700 million.

⁷See Remedial Education: Modifying Chapter 1 Formula Would Target More Funds to Those Most in Need (GAO/HRD-92-16, July 28, 1992).

⁸The programs for Migratory Children and the Emergency Immigrant Education Program are funded through an allocation formula based primarily on the size of a state's particular special needs population. The Bilingual Education Act's programs are funded through discretionary awards.

have reported significant increases in LEP, immigrant, and other “at-risk”⁹ student populations, straining existing educational resources.

Scope and Methodology

In October 1992 we contracted with Census to obtain a special tabulation of data from the 1980 and 1990 decennial censuses. The tabulation contains detailed information on children— persons from birth to 17 years—and their families, including data on their race/ethnicity, ability to speak English, immigration status, family income and type, parental educational attainment and employment status, and other characteristics. The tabulation includes this information for the urban and rural areas of every county in the United States, and these data can be aggregated by metropolitan area, state, region, and the nation.

However, an important limitation of our database is the lack of detailed information at the subcounty level. Although we can examine the urban and rural components of a county, we are unable to analyze populations in a town, school district, or any other geographic unit within a county.¹⁰ For a further discussion of the tabulation, see appendix II. Because the tabulation is based on the sample files of the 1980 and 1990 decennial censuses, the estimates we present have associated sampling errors. Data points for all figures in appendix I appear in appendix III. Tables containing detailed state-level data appear in appendix IV.

U.S. School Age Population Declined Between 1980 and 1990 but Became More Diverse

Our analysis of 1980 and 1990 decennial census data showed that there were about 44.4 million school age children (aged 5 to 17) in families in 1990.¹¹ This was a decline of more than 2.3 million, or 5.8 percent, since 1980.¹² School age children accounted for less than 19 percent of the national population in 1990, down from more than 21 percent in 1980.

⁹“At-risk” students are those who, while not necessarily poor, face significant obstacles to achieving academic success.

¹⁰Thus, we are unable to analyze intracounty variations in the characteristics of a population. For example, a county with a low school age poverty rate may actually contain several towns or even school districts with very high concentrations of poor school age children.

¹¹We focused on children aged 5 to 17 living in families—households where one or more persons are related—because this is the population used in the Chapter 1 allocation formula. This definition excludes those children for whom poverty status is not determined and those children whose poverty status is determined but who do not reside in families. See appendix II.

¹²In contrast, between 1980 and 1990 the number of preschool children (from birth to age 4) grew by about 12 percent, implying growth in the school age population since 1990.

During the 1980s, the total school age population became more racially and ethnically diverse. Between 1980 and 1990, the white school age population declined by more than 4 million children or about 12 percent, and the number of school age black children decreased by about 250,000 or about 4 percent. In contrast, the number of Hispanic school age children rose by 1.25 million, or 57 percent, and the number of Asian children grew by over 600,000—an 87-percent increase. (See fig. I.5.) By 1990, white children composed less than 70 percent of the total school age population, down from about 75 percent in 1980.

A Growing Population of Poor School Age Children Became More Racially/Ethnically Diverse

During the 1980s, the number of poor school age children grew by 6 percent—from about 7.2 million to 7.6 million. The national poverty rate for school age children increased from 15.3 percent to 17.1 percent.¹³ Like the total school age population, poor children became more racially and ethnically diverse. Again, while the number of poor white children declined and the black school age poverty population showed little change, the number of poor Hispanic and Asian children grew by almost 600,000.¹⁴ (See fig. I.7.)

White children continued to compose more than 40 percent of all poor school age children in 1990, but this percentage varied significantly by region. White children made up about a third of the urban school age poverty population but over two-thirds of all rural poor children.¹⁵ (See figs. I.8 and I.9.) Regardless of region, black children experienced the highest rates of school age poverty. The poverty rate for black children ranged from 34 percent in all urban areas to almost 41 percent in rural

¹³The decennial census typically fails to count a proportion of the population. For 1990, using different methods, Census estimated a total net undercount of between 4.2 million and 4.7 million persons. Because the extent of the net undercount appears to vary by race, age, and sex—for example the net undercount was particularly large for young black male adults—we may be underestimating the school age poverty rate. Using data from Census on all black children aged 5 to 17, revising the 1990 national school age poverty rate for the black youth undercount increases the poverty rate from 17.1 to about 17.2. See appendix II.

¹⁴Perhaps because of the recent recession, available evidence suggests that the percentage of school age children who are poor has increased since the 1990 census. For example, from its Current Population Survey, Census reported a 1991 annual poverty rate of almost 22 percent for all persons from birth to age 17 living in families, compared to 1990 decennial census rates of about 17 percent for persons living in families aged 5 to 17 and 20 percent for persons from birth to 4 years old.

¹⁵Census essentially defines urban as any census-designated place with more than 2,500 persons, with all remaining areas defined as rural. For Census's complete definition of urban, see appendix II. As an alternative measure, we also examined changes in the school age population between metropolitan and nonmetropolitan areas and found a similar distribution. In 1990, about 75 percent of all poor children resided in urban areas, while 71 percent of all poor children resided in metropolitan areas.

areas. (See fig. I.11.) Except for Asian children, rural children of each race and ethnic group had the highest poverty rates.

Family Characteristics of Poor School Age Children Differed by Race and Ethnicity

Poor children of different races and ethnic backgrounds had different profiles of family type, and parental educational attainment and employment status. For example, although 80 percent of poor black children lived in female-headed families with no husband, more than 70 percent of poor Asian children lived in married two-parent families. (See fig. I.12.)

The parents of poor children also varied by race and ethnicity in the educational attainment of the most educated parent. Poor Hispanic children had the largest proportion—37 percent—living in families where the educational attainment of the most educated parent did not exceed grade school. Although 32 percent of poor Asian children lived in families where the most educated parent had at most grade school education, 35 percent lived in families where the most educated parent had at least some college. (See fig. I.13.)

School Age Poverty More Concentrated in the West/Southwest, Although Many Southern States Maintained High Poverty Rates

The number of poor school age children became increasingly concentrated in the Western and Southwestern United States. During the 1980s, the number of poor school age children increased by more than 25 percent in 12 states. (See fig. I.17.) These 12 states also had increases in their poverty rates greater than the average national poverty rate increase. Except for Wisconsin, these states were located in the West and Southwest. In contrast, almost all of the 23 states where the school age poverty population declined were in the South and Northeast.

California and Texas, the two states with the largest school age poverty populations in 1990, also registered the largest numerical increases between 1980 and 1990 in poor school age children.¹⁶ (See fig. I.18.) Together, these two states gained almost 467,000 poor children during the 1980s. California and Texas dominated the growth in school age poverty even when compared to other states with large poor school age populations. For example, California and Texas accounted for more than 98 percent of the growth in school age poverty experienced during the

¹⁶California and Texas accounted for over 22 percent of the national school age poverty population in 1990, although they composed about 19 percent of the total school age population.

1980s by the 10 states with the largest populations of poor school age children.¹⁷

Although their total numbers of school age children declined, in 1990 many Southern states had the highest poverty rates in the nation. Of the 10 states with the highest school age poverty rates in 1990, 8 were in the South or were "border" states such as Kentucky and West Virginia. (See fig. I.20.) Of these eight Southern states, poverty rates increased in seven during the 1980s, although six of these seven states lost school age children during that period. (See figs. I.21 and I.22.)

Many Poor School Age Children Remain in Large Cities

During the 1980s, school age poverty also became more concentrated in our nation's largest cities. Almost 90 percent of the national increase in poor school age children was found in those counties containing the nation's 25 largest cities,¹⁸ even as these counties' total school age population declined. In 1990, these cities accounted for 25 percent of all poor children and registered a collective school age poverty rate of 21.6 percent.

Cities in the West and Southwest generally increased their numbers of poor school age children, while some Southern cities and many Eastern cities experienced declines in their school age poverty populations. (See table IV.10.) However, despite these losses, many Southern and Eastern cities maintained both large numbers of poor school age children and high poverty rates. Of the counties containing the 10 cities with the highest school age poverty rates in 1990, 7 were in the South and the East. (See fig. I.24.)

¹⁷The 10 states with the largest school age poverty populations in 1990 were California, Florida, Georgia, Illinois, Louisiana, Michigan, New York, Ohio, Pennsylvania, and Texas. Collectively, they contained about 57 percent of all poor school age children in 1990. These 10 states were also the largest in 1980, although their relative ranking changed during the decade.

¹⁸For a list of the counties identified by census as containing the 25 largest cities in total 1990 population, see appendix II.

Other At-Risk Populations Grew Rapidly and Were Concentrated Within Certain States

Children from at-risk groups—immigrant¹⁹ households, LI, and LEP children—each composed about 4 to 5 percent of all school age children (see fig. I.27), although some children fell into more than one of these groups.²⁰ Each of these populations experienced substantial growth between 1980 and 1990. For example, the number of children living in immigrant households rose by 24 percent during the decade, and the number of LEP children increased by almost 26 percent. (See fig. I.28.)

These at-risk school age populations were generally concentrated in a few states. Between 1980 and 1990, 6 states increased their school age immigrant population by 30 percent or more, while 30 states experienced declines. (See fig. I.31.) California and Texas dominated these increases. By 1990, these two states contained almost 50 percent of the nation's LEP children; California alone accounted for nearly 40 percent of the national school age immigrant population. (See fig. I.30.)

Like enrolled poor school age children, these at-risk children were more likely to attend public schools. About 92 percent of enrolled LEP, LI, and immigrant children attended public schools, compared to 96 percent of poor children and 89 percent of all enrolled school children. However, fewer than 80 percent of enrolled higher income children—children from families with incomes more than 50 percent of the poverty level—attended public schools.

Conclusion

Recent trends in the growth of the nation's school age poverty population may have important implications for the distribution of funds under ESEA's Chapter 1 program and other federal education programs. Assuming no change in the allocation formula and no increase in total program funding, available funds will have to be spread over a larger number of poor children. Further, Chapter 1's reliance on the number of poor school age children to allocate funds will cause a redistribution of resources toward the West and Southwest. Consequently, those states and counties that have lost poor children but still maintain very high numbers of poor children and school age poverty rates will receive reduced funding under the current formula.

¹⁹These are children who are foreign born of non-U.S. parents or native born children in families with a mother who immigrated to the United States during the 10 years before the census. See appendix II.

²⁰Correcting for the overlap, these populations totaled about 4 million children—over 9 percent of all school age children.

The growth in immigrant, LEP, and related at-risk populations also has consequences for many school districts throughout the nation. Some districts with expanding at-risk populations may face serious difficulty in matching available services to an increasingly diverse student body. This development may increase attention to federal programs that assist districts in addressing these problems.

As arranged with your office, we plan no further distribution of this briefing report until 5 days after its issue date. At that time, we will send copies to the Secretary of Education and other interested parties.

If you have any questions concerning this report, please call me at (202) 512-7014. Other major contributors to this briefing report are listed in appendix V.

School Age Demographics: Recent Trends Pose New Educational Challenges

Figure I.1: Assignment Objectives

Identify and analyze changes in size and characteristics of school age population.

Significance:

- Change in school age poverty population affects state and county allocations under ESEA Chapter 1 funding formula.
- Urban concentration of school age poverty indicates areas of "greater need."
- Growth of other "at-risk"¹ populations presents new challenges to states/school districts.

¹"At-risk" students are those who, while not necessarily poor, face significant obstacles to achieving academic success.

Figure I.2: Assignment Methodology

Analyze 1980 and 1990 Census data.

Focus on:

- Children aged 5 to 17, especially children in families with incomes below the poverty level.
- National and state profiles.
- Changes from 1980 to 1990.

Figure I.3: Results in Brief

During the 1980s:

- Although the total school age population declined, it became more racially and ethnically diverse.
- The number of poor school age children increased, and the population became more diverse.
- Poor school age children were increasingly concentrated in certain states/cities.
- Other at-risk school age populations grew rapidly and were concentrated in certain states.

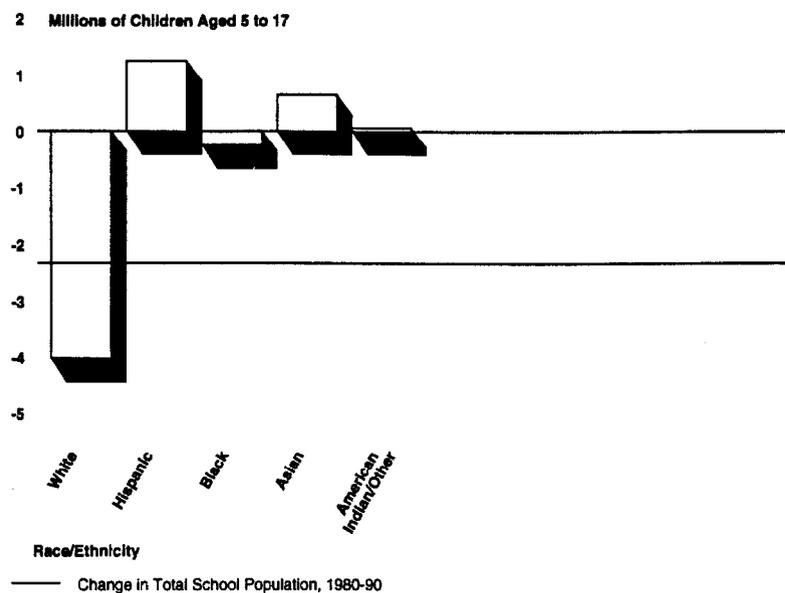

Figure I.4: Decline in School Age Population During 1980s

GAO analysis of Census data found 44.4 million school age children (5 - 17 years) in families in 1990--a decline of over 2.3 million, or 5 percent, since 1980.

School age children accounted for 18.4 percent of the total population in 1990, down from 21.3 percent in 1980.²

²In contrast, between 1980 and 1990, the number of preschool children (birth to 4 years) grew by about 12 percent.

Figure I.5: Changes in the School Age Population, by Race and Ethnicity, 1980-90

Decline and diversity of the school age population:

- Number of non-Hispanic white³ school age children declined by about 4 million, or almost 12 percent.
- Number of Hispanic and Asian school age children increased by over 1.8 million.

³In this report, the categories "white", "black", "Asian", and "American Indian/other" refer only to non-Hispanic members of those racial groups. All Hispanics--regardless of race--are included in the Hispanic category.

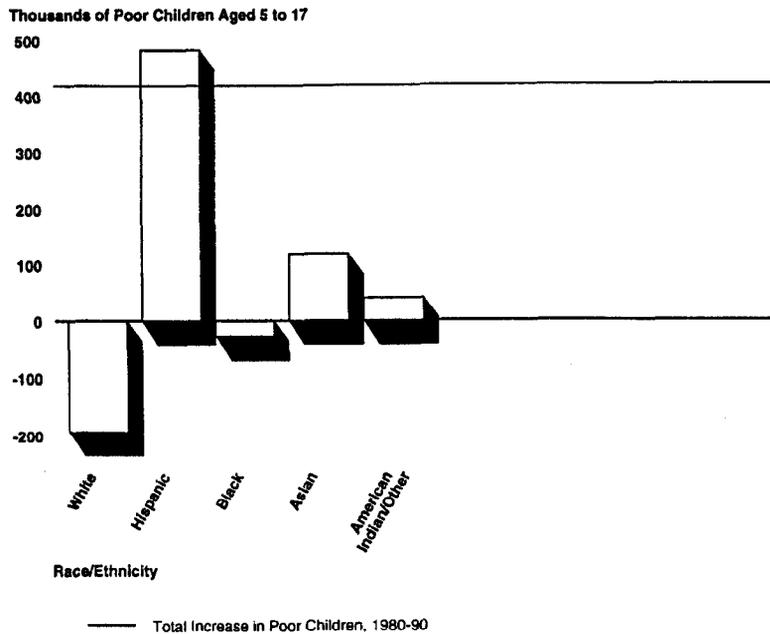

Figure I.6: Trends in the Number of School Age Children in Poverty, 1980-90

- The number of poor school age children increased 6 percent, from 7.2 million to about 7.6 million, and were more concentrated in certain states/cities.⁴
- The school age poverty population became more racially, ethnically, and socially diverse.
- The poverty rate--the proportion of school age children in poverty--increased to 17.1 percent in 1990, up from 15.3 percent in 1980.
- Poverty rates of school age children varied by race, ethnicity, and geographic area.

⁴The 1980 and 1990 decennial censuses report information on annual family or household income data for the prior years--1979 and 1989.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

Figure I.7: Change in the School Age Poverty Population, by Race and Ethnicity, 1980-90

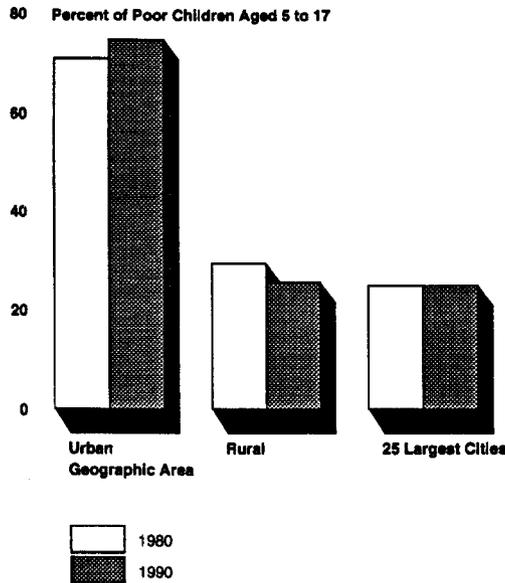

Growth and diversity of school age poverty:

- The number of poor white school age children declined during the 1980s.
- The black school age poverty population was stable.
- The increase in poor Hispanic children exceeded the total national increase in poor school age children.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

Figure I.8: Distribution of Poor School Age Children, by Geographic Area, 1980-90

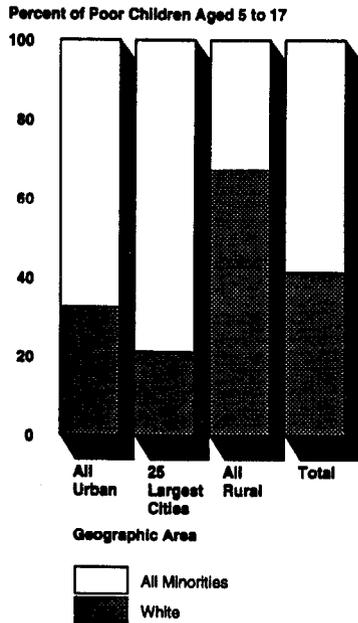

Note: Because our tabulation did not include information on individual cities, these data are for those counties defined by Census as containing the nation's 25 largest cities by total population in 1980 and 1990.

About 75 percent of all poor school age children lived in urban areas,⁵ up from about 71 percent in 1980.

⁵Census essentially defines urban as any "census designated place" with over 2,500 persons. For Census's complete definition of urban, see appendix II. In comparison, about 29 percent of all poor school age children resided in nonmetropolitan areas in 1990, compared to about 30 percent in 1980.

Figure I.9: Racial Composition of Poor School Age Children, by Geographic Area, 1990

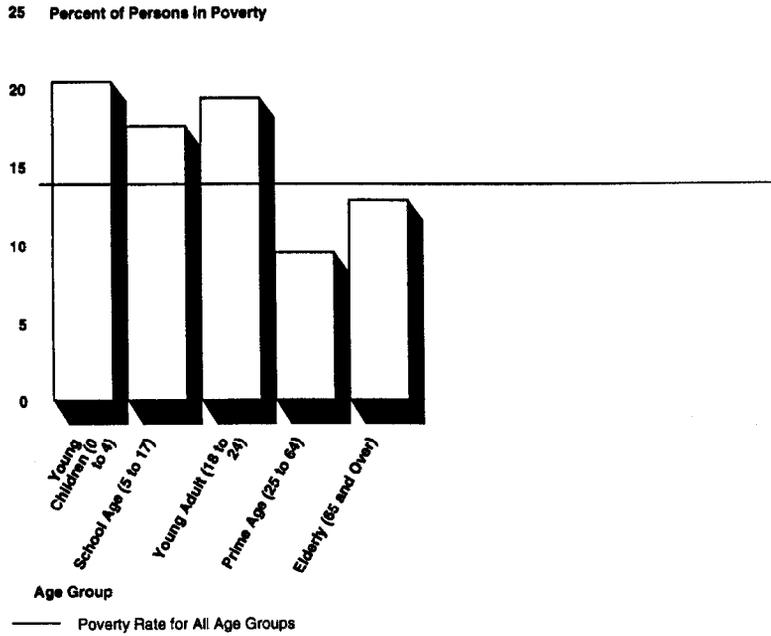

The composition of school age poverty population varied by geographic area:

- White children composed a third of the urban school age poverty population but over two-thirds of the rural poverty population.
- Minorities made up almost 80 percent of all poor school age children in large cities.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

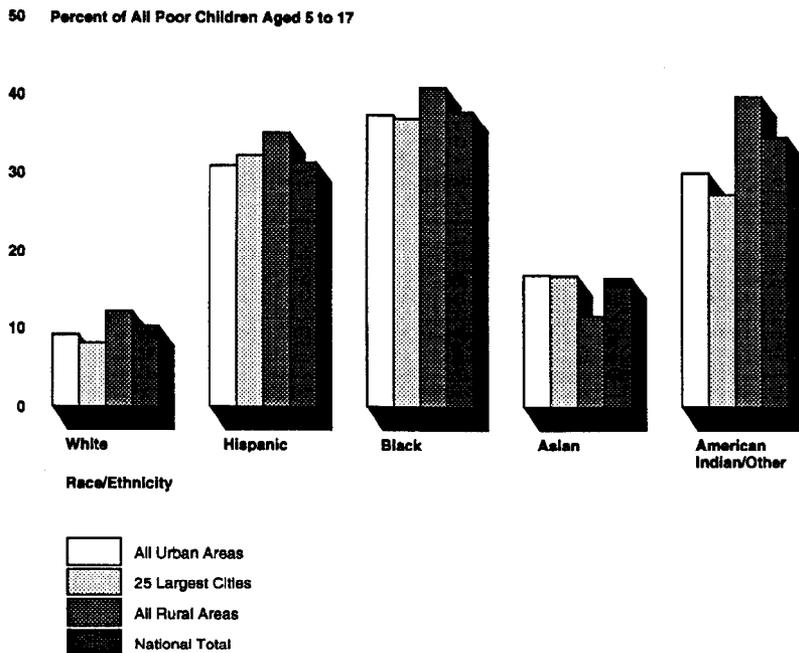

Figure I.10: Comparison of Poverty Rates Across Age Groups, 1990

Over 20 percent of all young children (from birth to 4 years) lived in families with incomes below the poverty level.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

Figure I.11: Racial and Ethnic Poverty Rates, by Geographic Area, 1990

- School age black children consistently had the highest poverty rates.
- Rural areas displayed the highest poverty rates for most racial and ethnic groups.

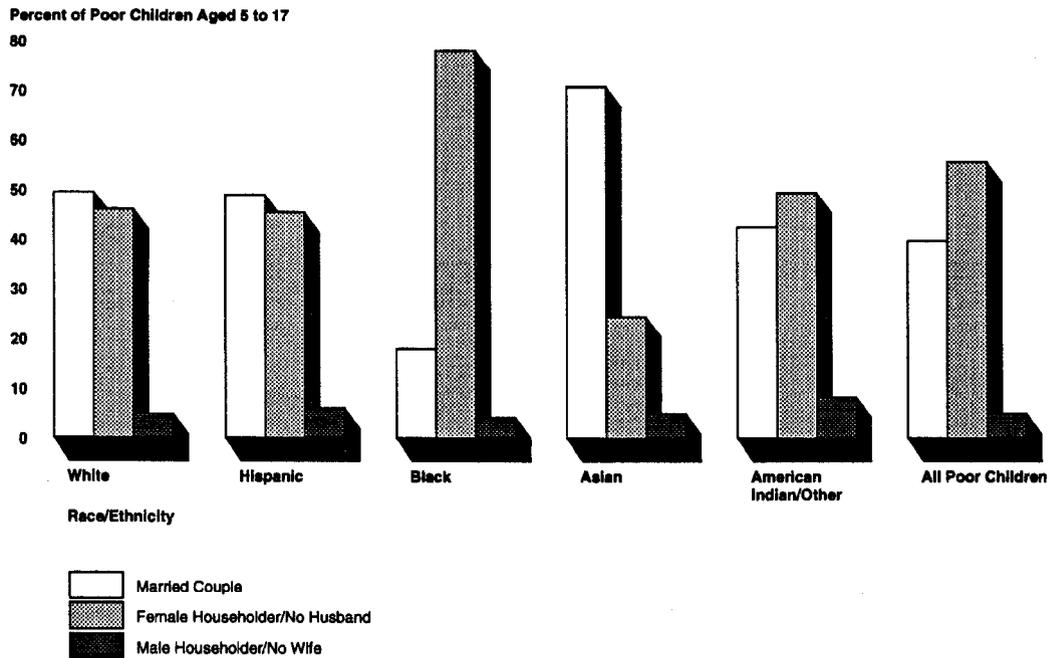

Figure I.12: Differences in Family Characteristics of Poor School Age Children, by Race and Ethnicity, 1990

Poor families of different races/ethnicities with school age children varied by:

- Family type.
- Education level of most educated parent.
- Parents' employment experience.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

Figure I.13: Family Type of the School Age Poverty Population, by Race and Ethnicity, 1990

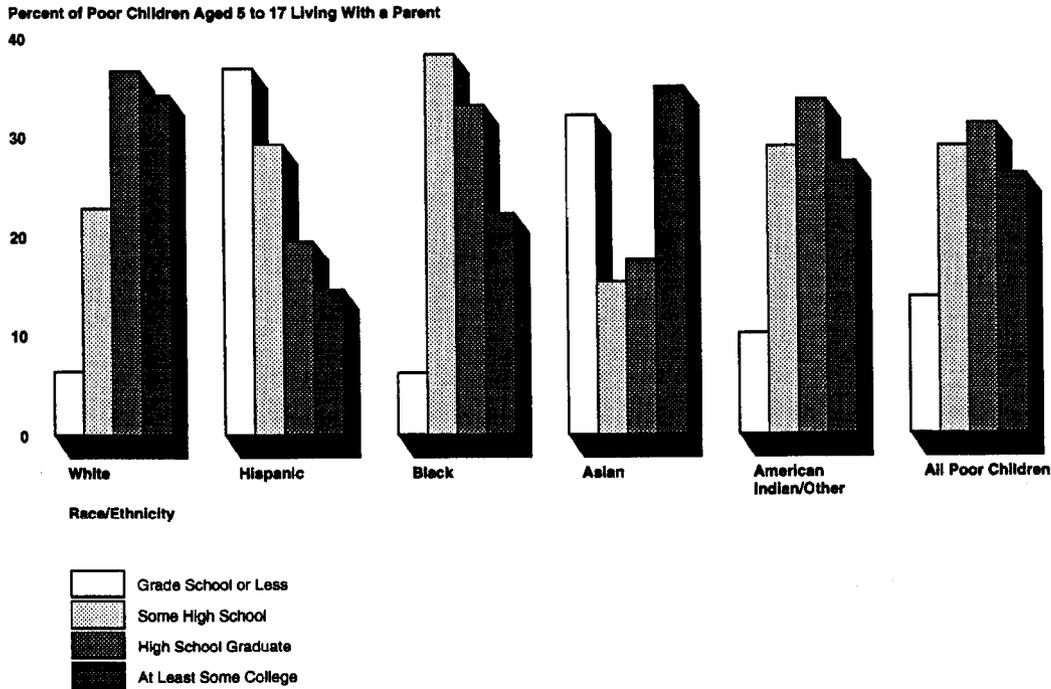

- Almost 80 percent of poor black children lived in households headed by a female with no husband.⁶
- Over 70 percent of poor Asian children lived in married couple families.

⁶These data include all households containing school age children classified by family type. Thus, a widowed grandmother caring for poor school age children would be included in the female head/no husband category.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

Figure I.14: Parental Education Status of the School Age Poverty Population, by Race and Ethnicity, 1990

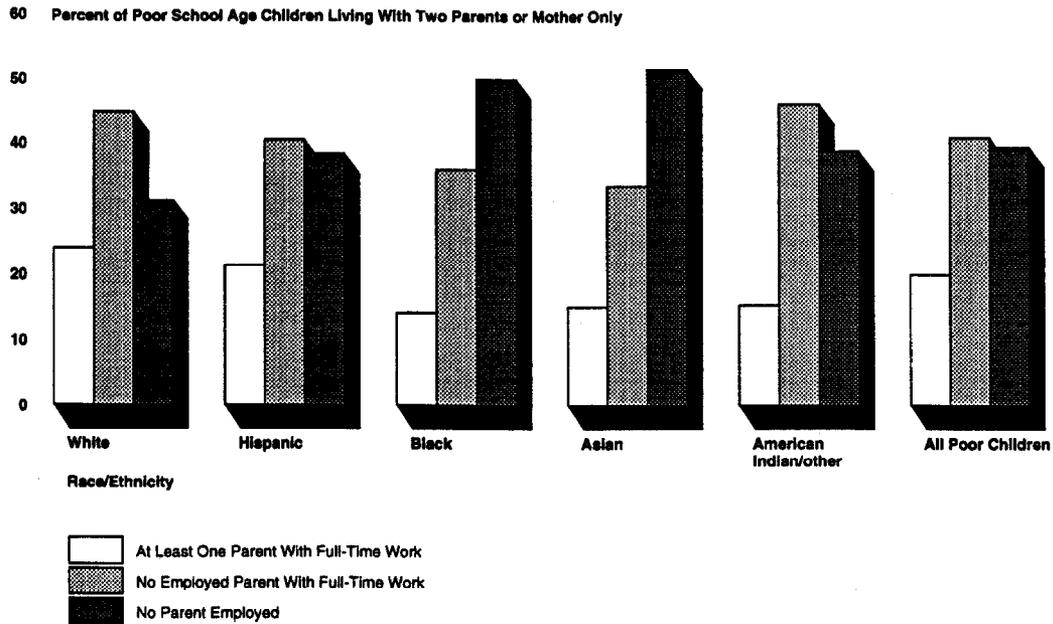

Note: We define educational status as the amount of education attained by the parent with the higher level of education. The figure includes information on poor children in families headed by parents only.

- Poor Hispanic children were most likely to live in families where no parent had more than a grade school education.
- Poor white children were most likely to live in families where at least one parent was a high school graduate.

**Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges**

Figure I.15: Parental Employment Status of the School Age Poverty Population, by Race and Ethnicity, 1990

Note: The tabulation only contains data on the employment status of parents of poor children in two-parent families or single-parent, female-headed families. It excludes single-parent, male-headed families and families not headed by a parent.

Poor black and Asian children were most likely to live in families with no employed parent.

Figure I.16: Trends in the State Concentration of the School Age Poor, 1980-90

Between 1980 and 1990:

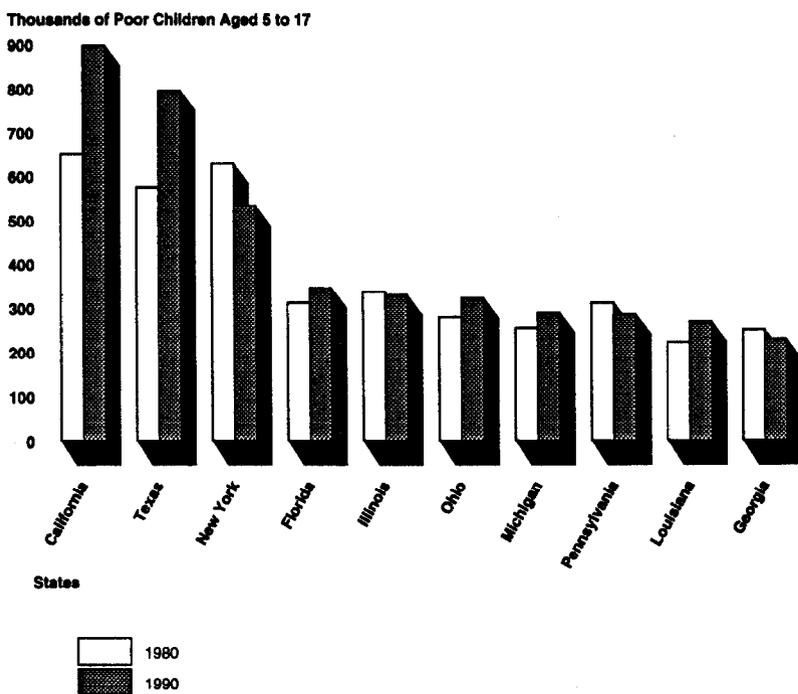

- The number of poor school age children decreased in 24 mostly Southern and Eastern states.
- Eleven of the 12 states with the largest percentage increases in the school age poverty population were in the West and Southwest.
- The poverty rate of these 12 states grew faster than the increase in the national poverty rate.

California and Texas:

- Registered the largest numerical state increases in school age poor with total of 467,000 between 1980 and 1990.
- Accounted for almost all the growth in the number of poor children among the 10 states with largest school age poverty populations.
- Increased their school age poverty rate from 16 percent in 1980 to 19.7 percent in 1990.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

Figure I.18: Changes in the School Age Poverty Population in 10 States With Largest School Age Poverty Populations, 1980-90

Note: Census reported that these states had the largest school age poverty populations in both the 1980 and 1990 decennial censuses.

During the 1980s, the number of poor school age children decreased in 4 of the 10 states with the largest school age poverty populations.

Figure I.19: Trends in the State Concentration of the School Age Poor, 1980-90

Some states with decreased numbers of poor school age children still had high levels of school age poverty.

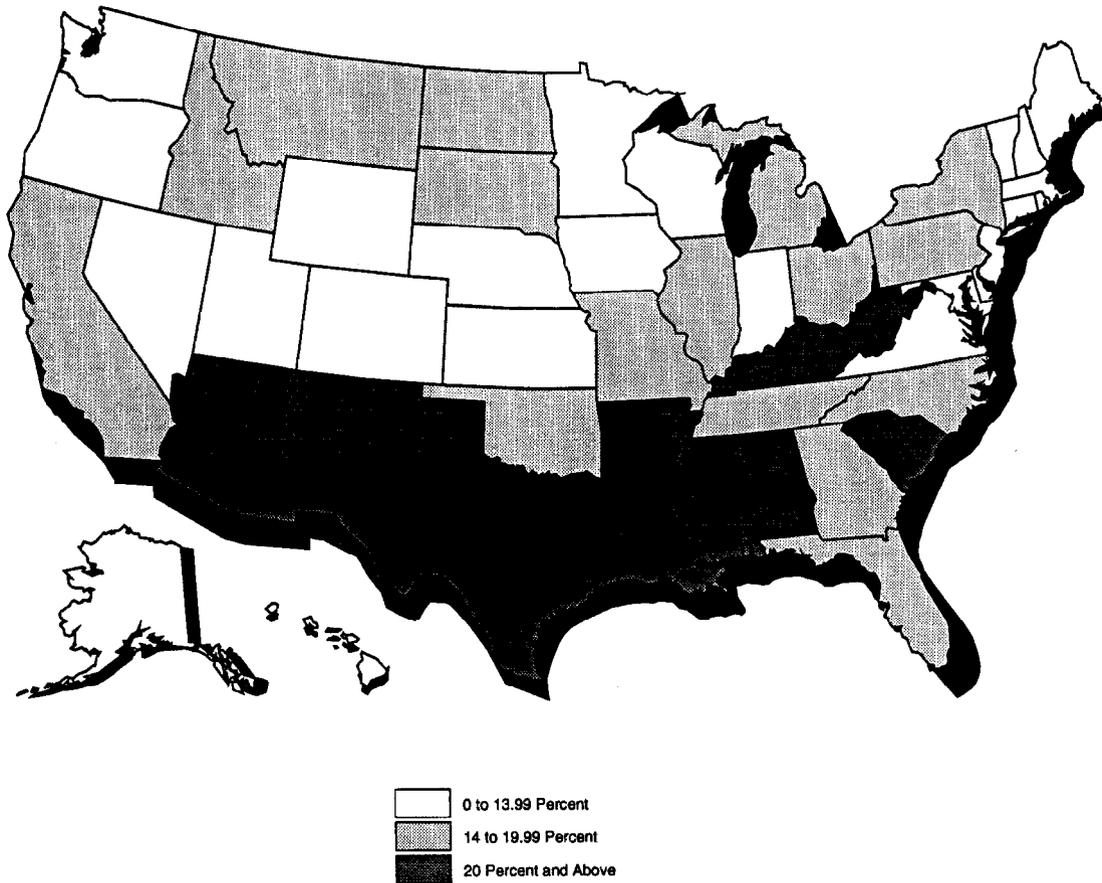

- Of the 10 states with the highest school age poverty rates in 1990, 8 were Southern and "border" states.

Of these eight states:

- Seven had decreases in the total number of school age children.
- Three had increases in the number of poor school age children.
- Seven increased their poverty rates during the 1980s.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

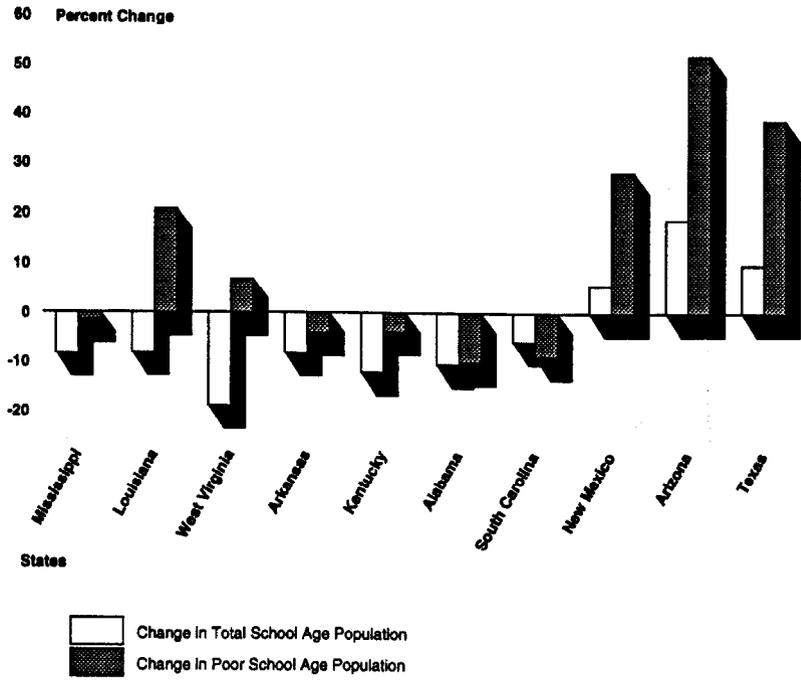

Figure I.20: School Age Poverty Rates, by State, 1990

In 1990, 10 states had school age poverty rates of over 20 percent.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

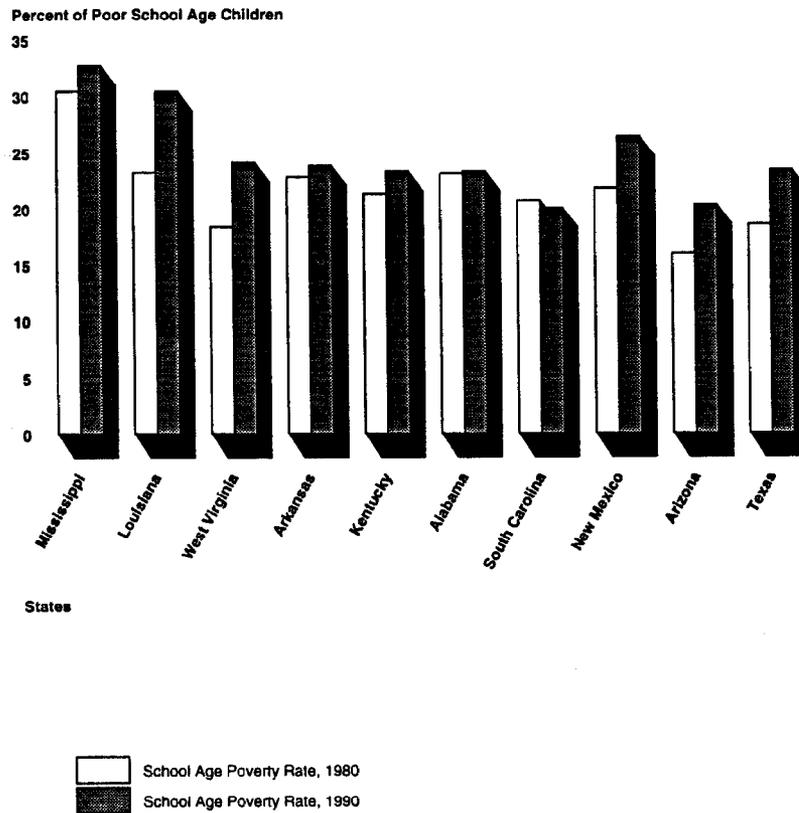

Figure I.21: Changes in Total and Poor School Age Populations, 1980-90, for 10 States With Highest School Age Poverty Rates in 1990

The total number of school age poor declined in 7 of the 10 states that had the highest school age poverty rates in 1990.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

Figure I.22: Changes in Poverty Rates, 1980-90, for the 10 States With Highest Poverty Rates in 1990

Poverty rates increased in 9 of the 10 states that had the highest school age poverty rates in 1990.

Figure I.23: Poor School Age Children Were Increasingly Concentrated in Large Cities

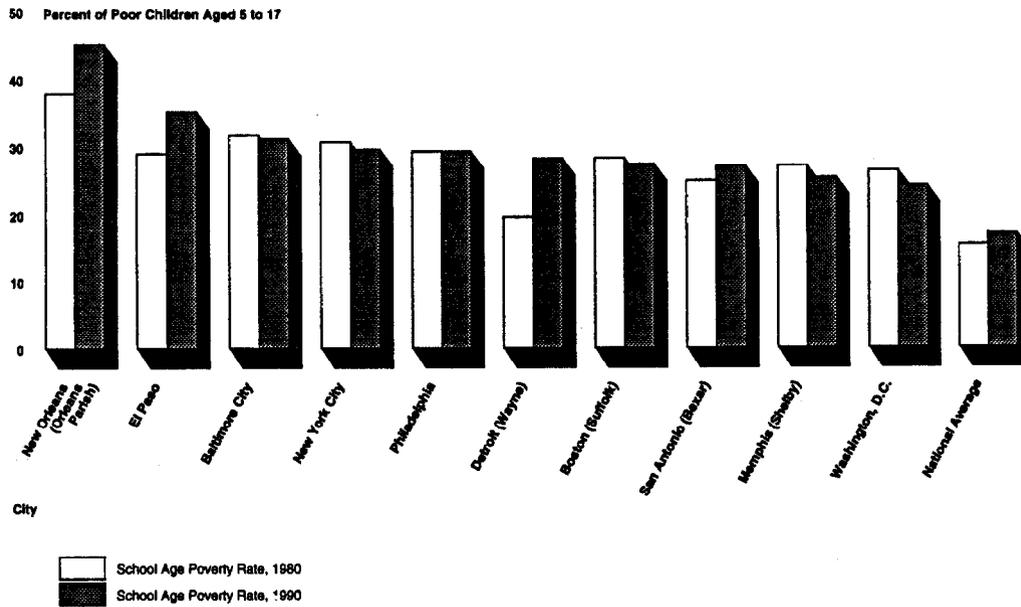

By 1990, the 25 largest cities

- Contained about a quarter of all poor school age children.
- Lost 371,000 school age children in total but increased their poor school age population by 106,000.
- Increased their poverty rate from 19.5 percent in 1980 to 21.6 percent--higher than the 15.6-percent rate for rural areas and the 17.6-percent rate for all urban areas.

Although many Eastern and some Southern cities experienced declines in their school age poverty populations during the 1980s, they retained both large numbers of poor children and substantial school age poverty rates.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

Figure I.24: Change in School Age Poverty Rates, 1980-90, 10 Cities With Highest School Age Poverty Rates in 1990

Seven of the 10 cities with the highest school age poverty rates in 1990 were in the East or the South.

Figure I.25: Definitions of Selected "At-Risk" School Age Populations

"At-risk" populations other than poor school age children:

- Children from immigrant families--children who are foreign born or native born in families with a mother who recently immigrated.
- Children in linguistically isolated households (LI)-- children living in households where no person 14 years or older speaks English only or speaks English very well.
- Children with limited English proficiency (LEP)-- children 5 years and older reported by Census as speaking English well, not speaking English well or not speaking English at all.⁷

⁷For all persons aged 5 and over, Census classifies their ability to speak English into five categories: "speaking English only," "speaking English very well," "speaking English well," "not speaking English well," and "speaking English only." Our LEP definition of combining the last three categories is also employed by the Congressional Research Service when it uses census data to estimate the LEP population.

Figure I.26: Trends in Selected At-Risk School Age Populations, 1980-90

At-risk populations remain small but are growing rapidly.⁸

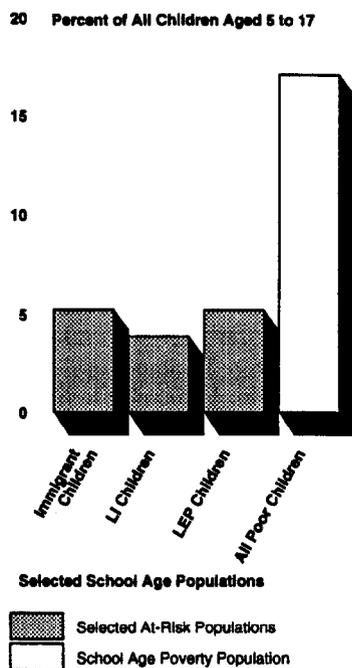

At-risk children:

- Have higher poverty rates than those for all school age children.
- Are concentrated in a few states.
- Are more likely to attend public school than the general school age population.

⁸The immigrant, LI, and LEP populations are not additive because some children fall into one or more of these categories. In 1990, over 686,000 school age children were in all three categories. However, 2.3 million children--over 5 percent of all school age children--were in one of the three "at-risk" categories exclusively.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

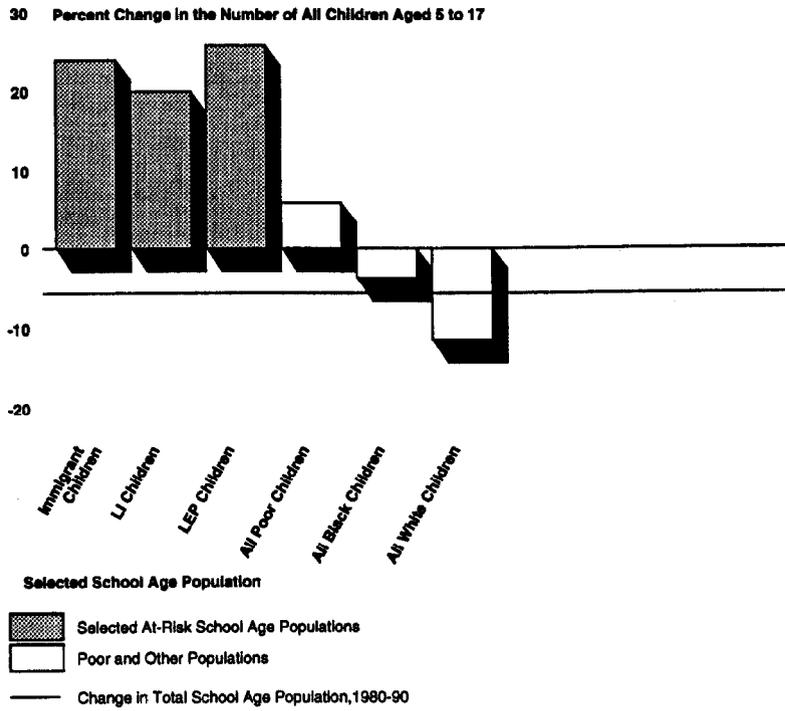

Figure I.27: Size of Selected At-Risk School Age Populations, 1990

LEP children and other at-risk groups each ranged in size from about 4 to 5 percent of the total school age population.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

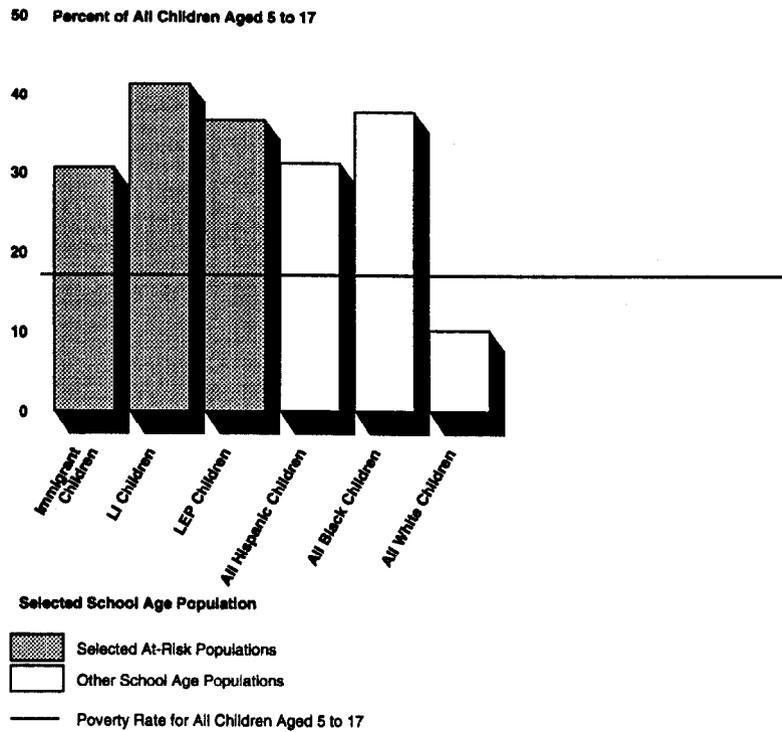

Figure I.28: Percent Change in Selected At-Risk and Other School Age Populations, 1980-90

Between 1980 and 1990, the size of LEP and other at-risk groups grew while the total school age population declined.

Appendix I
 School Age Demographics: Recent Trends
 Pose New Educational Challenges

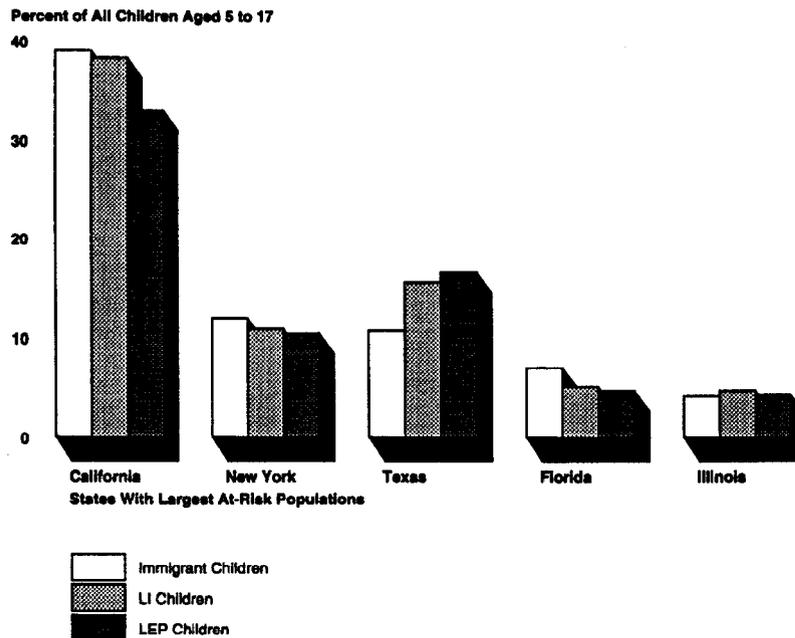

Figure I.29: Poverty Rates of Selected At-Risk and Other School Age Populations, 1990

Like black and Hispanic school age children, over 30 percent of immigrant, LI, and LEP school age children were poor.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

Figure I.30: Concentration of At-Risk School Age Children in Five States With Largest At-Risk School Age Populations, 1990

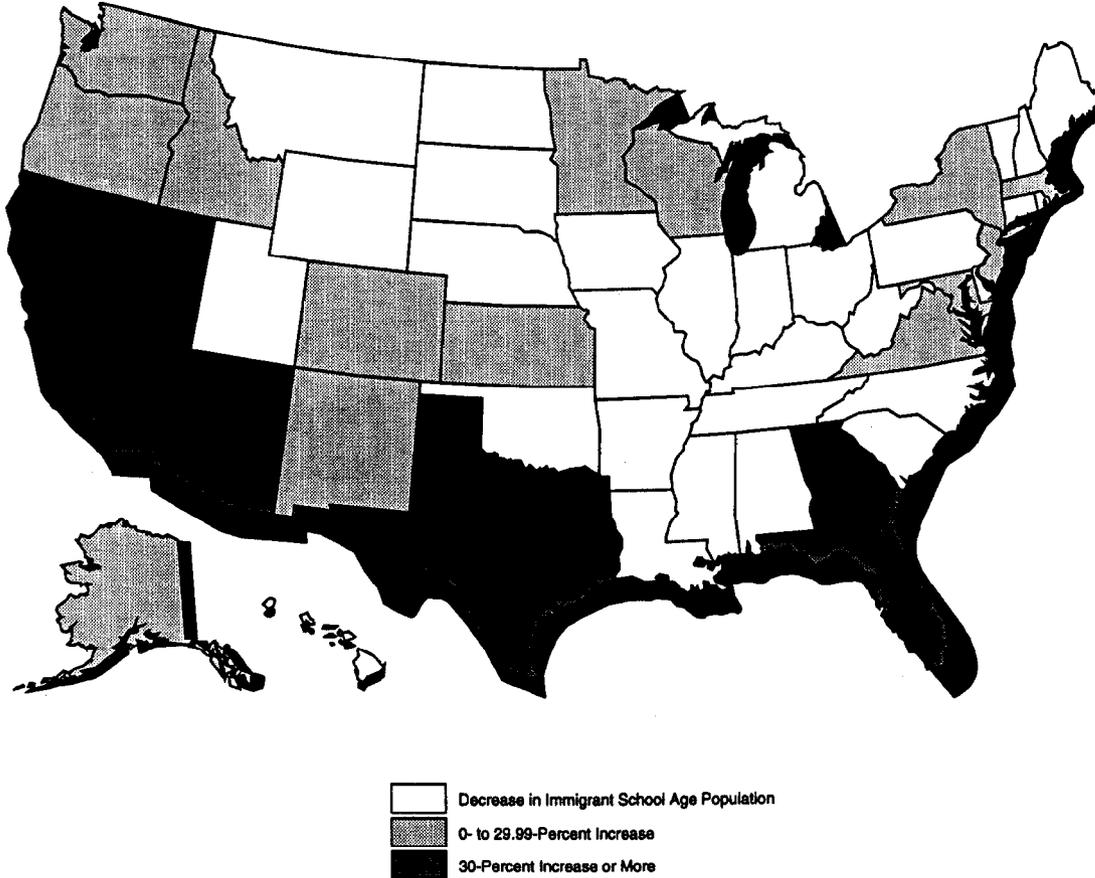

At-risk children are concentrated in a few states:

- California had almost 40 percent of all immigrant children.
- California, Texas, and New York accounted for about 60 percent of all LEP children.
- California, Texas, New York, Florida, and Illinois contained almost 75 percent of all LI children.

Appendix I
School Age Demographics: Recent Trends
Pose New Educational Challenges

Figure I.31: Percent Change in State Immigrant School Age Populations, 1980-90

Although 30 states experienced declines in their immigrant school age populations, 6 states had increases of 30 percent or more.

Figure I.32: Almost 90 Percent of All Enrolled Children Attended Public School in 1990

Poor and at-risk children were more likely to be enrolled in public school

- almost 96 percent of enrolled poor children attended public schools;
- about 92 percent of enrolled immigrant, LI, and LEP children attended public schools.

Fewer than 80 percent of all enrolled children who came from families with incomes over 500 percent of the poverty level attended public schools.

Scope and Methodology

To identify the best data available, we held discussions with Bureau of the Census officials, academic experts, and an outside consultant. From these discussions, we found that a tabulation of 1980 and 1990 decennial census data designed to our specifications regarding the characteristics of school age children would most effectively meet our needs. We conducted our review between September 1992 and May 1993 in accordance with generally accepted government auditing standards.

The Special Tabulation of 1980 and 1990 Decennial Census Data

In October 1992, we contracted with the Bureau of the Census to obtain a specially designed tabulation of 1980 and 1990 decennial census data. This tabulation is a subset of the 1980 and 1990 Decennial Census Sample Edited Detail Files containing characteristics of the population of specific geographic units. Census created the tabulation from its detailed sample files containing individual records on the population of the entire United States. Census' 1990 detailed files represent a 15.5-percent sample of the total U.S. population and a 16-percent sample of all U.S. households. Census' 1980 detailed files represent an 18.2-percent sample of the total U.S. population and an 18.4-percent sample of all U.S. households.

Although we identified other sources of data that addressed some of the requesters' concerns, weaknesses in these sources led us to choose a special tabulation of 1980 and 1990 decennial census data. For example, some information on the characteristics of school age children is available from the March and October annual Current Population Survey (CPS) supplements. However, the 1992 CPS supplement files would likely not be available until spring 1993. In addition, because of its far smaller sample size, the CPS does not permit statistically meaningful analysis of many state populations. Finally, the funding allocation formula of ESEA's Chapter 1 program, the largest federally funded education program and a program of great interest to our requesters, considers decennial census data as one of its factors in distributing funds to states and counties.

Tabulation Contents—
Geographic, Age, Income,
and Racial/Ethnic
Characteristics

The tabulation contains detailed information on the economic, social, and demographic characteristics of the U.S. population, with a particular focus on children—persons aged 0 to 17—living in families.¹ The tabulation contains this information for certain geographic units and age groups, and generally includes comparable data for both 1980 and 1990.

Geographic Location

The tabulation includes detailed characteristics on the population of the urban and rural sections of every county or county equivalent² in the United States, including Alaska and Hawaii.³ The urban section of each county represents the aggregation of

- places of 2,500 or more persons incorporated as cities, villages, boroughs, and towns, excluding the rural parts of extended cities;⁴
- census-designated places of 2,500 or more persons; and
- other territory, incorporated or unincorporated, included in urbanized areas in that county.

Census defines all remaining areas of a county as rural. The tabulation data for the urban and rural sections of a county can be aggregated to compose the entire county. Counties can be aggregated into states, regions, or the nation.

The tabulation also permits the analysis of the detailed characteristics of populations residing in metropolitan areas (MA). MAs are counties or groups of counties⁵ that have close economic and social relationships with each other and meet the standards for defining metropolitan areas set by

¹Census defines a family as consisting of a householder and one or more other persons living in the same household who are related to the householder by birth, marriage, or adoption. A household includes all the persons who occupy a housing unit—a house, an apartment, a mobile home, a group of rooms, or a single room that is occupied as separate living quarters. All persons in a household who are related to the householder are regarded as members of his or her family. A household can contain only one family for purposes of census tabulations. Not all households contain families since a household may comprise a group of unrelated individuals or one person living alone.

²In Louisiana the county equivalent is the parish. In Alaska, county equivalents are organized as boroughs and census areas. Some states—like Maryland—have “independent cities,” which are treated as counties for statistical purposes.

³Our tabulation does not include information on the population of Puerto Rico, American Samoa, or other outlying areas of the United States.

⁴Census aggregates the boroughs of a county in all states except Alaska and New York. Census aggregates the towns of a county in all states except New York and Wisconsin and the six New England states—Connecticut, Massachusetts, Maine, New Hampshire, Rhode Island, and Vermont.

⁵The tabulation also includes information on metropolitan areas in the six New England states, where they are defined as the aggregation of minor civil divisions rather than counties.

OMB. The tabulation includes both 1980 and 1990 census data on MAS based on 1990 geographic boundary definitions in its January 1990 revisions.

Age

For both 1980 and 1990, the tabulation contains information on populations by single year of age for persons from birth through age 7. It also includes information on persons in age groups 8 to 11, 12 to 17, 18 to 24, 25 to 64, and 65 years and over.

Poverty Status/Income

The tabulation contains information on household income and poverty status for all persons for whom the Census can determine a poverty status.⁶ Census derives information on income and poverty status from answers to census questions concerning income received by persons 15 years and older during the calendar year before the census year. Thus, the 1990 decennial census contains information on persons' 1989 calendar year income. Information on persons' poverty status in the tabulation is based on the standard definition of poverty status used by Census and prescribed by OMB as a statistical standard for federal agencies.⁷

Analysts have criticized the poverty threshold for being both too high or too low. For example, the existing poverty thresholds do not account for area cost-of-living differences. Price differences among areas imply that more expensive areas need higher incomes to maintain adequate levels of consumption. Because some parts of the country (for example, the Northeast and urban areas generally) have higher prices than others, families that live in these areas may need higher incomes to maintain the same level of consumption as lower income families in less expensive places. Correcting for this difference in price levels would tend to increase poverty rates in areas with a higher cost of living and lower them in others, even after adjusting for differences in median income.

Race and Ethnicity

The tabulation contains information on 22 separate racial and ethnic classifications. (See table II.1.) The tabulation's racial/ethnic classifications are based on the Census question regarding Hispanic origin. Thus, the non-Hispanic classifications—white, black, and so on—are for

⁶Census does not determine poverty status for institutionalized persons, persons in military group quarters and in college dormitories, and unrelated individuals under 15 years of age. These persons are excluded from the denominator when Census calculates poverty rates—the percentage of persons in poverty.

⁷Census determines poverty thresholds on the basis of family size and the corresponding poverty level income for that family size. The Census and GAO tabulation classifies the family income of each family or unrelated individual according to their corresponding family size category. For example, for the 1990 census, the poverty cutoff for a family of four was a 1989 income of \$12,674. Census counts an individual or family and its members as poor if its annual before-tax cash income is below the corresponding poverty threshold for that size of family.

non-Hispanic members of those racial groups only. The Hispanic categories include Hispanic persons of all races. The tabulation includes racial and ethnic classifications that are comparable in definition for 1980 and 1990, except for the categories "Central/South American" and "Other Hispanic." Census calculated the "Central/South American" classification for 1990 but not for 1980, when it included these persons in the "Other Hispanic" classification.

Table II.1: Contents of the Special Tabulation: Racial and Ethnic Characteristics, 1980 and 1990 Decennial Censuses

[Redacted Header]	
Not of Hispanic origin:	Hispanic origin:

Hawaiian	
American Indian, Eskimo, or Aleut	
Other races	

**Tabulation Contents—Other Social and Demographic Characteristics
Family Type**

The tabulation also contains information on family type, parental employment status, educational attainment, and similar social characteristics. (See table II.2.) Except where noted, data are comparable for both 1980 and 1990.

The tabulation includes information on family type, classifying all persons in families even when the family does not include a parent. For example, a family with children headed by a grandmother with no spouse is included in the category of female householder-no husband.

Parental Employment Status

The tabulation's work experience variable focuses on persons in families with two parents or single-parent families including the mother only. Like the 1980 and 1990 decennial censuses, the tabulation does not contain information on the parental work experience of families headed by any other relative (grandmother, aunt, uncle, and so on) or single-parent families headed by the father. The tabulation includes comparable data on this variable for both 1980 and 1990.

Parental Educational Attainment

The tabulation's variable for the education level of the most educated parent includes information only on persons in families with parents.⁸ The tabulation contains information on persons in families where at least one parent is present. However, it does not classify other types of families, for example, those headed by grandmothers, uncles, and so on, by educational attainment.

Census included instructions with its questionnaire that specified that schooling completed in foreign or ungraded systems should be reported as the equivalent level of schooling in the regular American system and that vocational certificates or diplomas from vocational, trade, or business schools or colleges were not to be reported unless they were college-level degrees. Census also asked respondents to exclude honorary degrees.

Although the tabulation includes comparable data on the educational attainment question for both 1980 and 1990, the construction of the data for each year is different. Tabulation data for 1990 conforms to the 1990 decennial census's question regarding educational attainment. Instead of educational attainment, the 1980 Census question was based primarily on the number of years of education acquired by each respondent. However, the tabulation contains the 1980 data translated by Census into the 1990 categories.⁹

Immigrant Status

The tabulation's immigrant variable includes information on those persons who are foreign born and not of U.S. parents. It also includes a separate "first generation" or "recent arrival" category for those persons who are

⁸We chose to focus on the educational attainment of the most educated parent because many analyses have found that "educated status of the more educated parent" is highly correlated with educational outcomes as well as social behaviors such as career choice.

⁹Census translated the 1980 years of education totals as follows: completed 8 years of education or less to "Grade School or Less," completed 9 to 11 years to "Some High School (9-12, no diploma)," completed 12 years to "High School Graduate (diploma)," completed 13 to 15 years to "Some College or Associate's Degree," completed 16 years or more to "Bachelor's Degree or more." The "No Parent Present" category did not change.

native born but who have a foreign-born mother¹⁰ who came to the United States during the 10 years before the Census.¹¹ In this report, we typically define the foreign born and recent arrival categories as “immigrant.”

Place of Origin

The tabulation contains information on persons’ place of birth or origin, distributing them among 30 different national classifications. Persons listed as “U.S. native” may have been born in the United States, Puerto Rico, or an outlying area of the United States. Persons born in foreign countries but who have at least one American parent are also included as U.S. natives.

Table II.2: Contents of the Special Tabulation: Demographic Characteristics, 1980 and 1990 Decennial Censuses

Family type:^a	
Married-couple family	
Female householder, no husband present	
Male householder, no wife present	
Work experience (employment status) of parents in 1989:^a	
Living with two parents:	Living with mother:
Both parents worked full time, full year	Mother worked full time, full year
Only one parent worked full time, full year	Mother worked part time or part year
Neither parent worked full time, full year	Mother did not work
Neither parent worked	
Living with father	
Not living with a parent	
Immigrant status:^a	
Foreign born	
First generation (recent arrival)	
Nonimmigrant	
Education level of most educated parent:^a	
Grade school or less	
Some high school (9-12, no diploma)	
High school graduate (diploma)	
(continued)	

¹⁰Although somewhat more narrow, this definition is consistent with research definitions of the foreign stock population. The foreign stock population is considered crucial to understanding that segment of the population with the strongest foreign language and cultural experience.

¹¹For 1980, the recent arrival category includes native born children with a foreign born mother who immigrated to the United States during the previous 10 years (back to 1970). For those children who have no mother, the question examines the father’s place of origin. Children without either parent are classified as nonimmigrant.

^g"Other European nations" includes Austria, the former East Germany, and all other European nations not classified.

^h"North Africa" includes Algeria; Egypt; Libya; Morocco; North Africa, not specified; Tunisia; and Western Sahara.

ⁱ"Other African nations" includes all other African nations not classified elsewhere.

^j"All other nations" includes Australia, Oceania, and all nations not classified elsewhere.

School Enrollment

The tabulation also contains information on persons' enrollment in school and whether the school was public or private. The 1990 Census defined public school as any "school or college controlled and supported by a local, county, state or federal government." Schools supported and controlled by religious organizations or other private groups are defined by the 1990 Census as "private." The tabulation provides comparable data for 1980 and 1990.¹²

Tabulation
Contents—Language
Characteristics

The tabulation also contains information on the language spoken by the householder, English proficiency, and linguistic isolation. (See table II.3.) Except where noted, the tabulation has comparable data for these variables for both 1980 and 1990.

¹²Census has observed that school enrollment levels for persons aged 3 to 17 in 1990 may be underestimated by about 5 percent, with preprimary enrollment most seriously underestimated. However, at this time, Census has no explanation for the discrepancy.

Linguistic Isolation

The tabulation includes information on persons living in linguistically isolated (LI) households. (See table II.3.) These are households in which no persons aged 14 or older speak "only English" and no persons aged 14 or older who speak a language other than English speak English "very well." The tabulation classifies all members of an LI household as LI, including members who may speak "only English."

Ability to Speak English

The tabulation includes information on persons 5 years of age and older on the basis of their ability to speak English. Categories include persons who "speak English only," "speak English very well," "speak English well," "do not speak English well," and do "not speak English at all."

Language Spoken Other Than English

For those households in which one or more persons aged 5 years or over speak a language other than English, the tabulation includes information on the language spoken by the householder. The tabulation distributes such persons among 16 different language classifications. The language spoken by the householder may not be spoken by all other members of the household. Thus, persons who speak only English may have a non-English household language assigned to them.

**Appendix II
Scope and Methodology**

Table II.3: Contents of the Special Tabulation: Linguistic Characteristics, 1980 and 1990 Decennial Censuses

Linguistic isolation: ^a	
In LI households	In non-LI households
Language spoken at home: ^a	
English spoken only	Language spoken other than English:
	Spanish

Ability to speak English: ^b	
Speaks only English	Does not speak only English:
	Speaks English very well
	Speaks English well
	Speaks English not well
	Speaks English not at all

^aThis variable places persons aged birth to 17 who are not in a family in a separate category.

^bThis variable places persons aged 5 to 17 who are not in a family in a separate category. It excludes all persons under 5 years of age.

Variables Created From the Special Tabulation

GAO Definition of Children With Limited English Proficiency (LEP)

Using the special tabulation data for 1980 and 1990, we created a variable classifying children by their English proficiency. In general, LEP children have difficulty speaking, reading, writing, or understanding English.

However, currently, no nationally accepted definition of LEP exists, and there is a lack of consensus on the criteria for determining LEP. This is particularly true regarding the level of language skills that constitutes limited proficiency in English.

Following the definition used by the Congressional Research Service when it uses census data to estimate the LEP population, we defined as LEP children all persons aged 5 to 17 living in families who Census reported as speaking English “well,” “not well,” or “not at all.”¹³ Current estimates by the Department of Education, the Council of State Chief School Officers, and other sources place the number of total school age LEP students at between 2.3 million and 3.5 million. Our definition yields an estimate of slightly more than 2.3 million children.

GAO’s Parental Employment Status Variable

The tabulation’s work experience variable focuses only on persons in families with two parents or single-parent families including the mother only. The tabulation does not contain information on parental work experience of families headed by any other relative (grandmother, aunt, uncle, and so on) or single-parent families headed by the father. GAO defined a parental employment experience variable by collapsing the tabulation’s parental employment status variable in the following manner:

- At Least One Parent With Full-Time (Full-Year) Work includes all persons aged 5 to 17 in families in which “both parents worked full time, full year,” “only one parent worked full time, full year,” and all persons aged 5 to 17 in single-parent families headed by the mother in which “the mother worked full time, full year”;
- No Employed Parent With Full-Time (Full-Year) Work includes all persons aged 5 to 17 in families in which “neither parent worked full time, full year” and all persons aged 5 to 17 in single-parent families headed by the mother in which “the mother worked part time or part year”;
- No parent employed includes persons aged 5 to 17 in families in which “neither parent worked” and all persons aged 5 to 17 in single-parent families headed by the mother in which “the mother did not work.”

Overlap of GAO-Designated At-Risk Populations

In this report we define members of an at-risk population as persons aged 5 to 17 in families who also either meet our definition of LEP or live in an

¹³There are several reasons for defining a person who speaks English “well” as LEP. First, analysis by Census performed on adults during the early 1980s suggested that the “speaks English well” category had considerable variation in actual English speaking ability—many who said they spoke English well did not do so—and such variation may be just as large among children. In addition, there are other dimensions of LEP—some may speak English well but may be unable to read it or understand it.

immigrant or an LI household.¹⁴ Our analysis of tabulation data found that each of these at-risk populations ranged from about 4 to 5 percent of the total school age population in families.

However, the totals for these groups are not additive because a child may be in more than one of these populations. Table II.4 illustrates the overlap among these at-risk groups. For example, about half of all children in immigrant households (1.1 million) were also not LEP or were not living in an LI household. About 20 percent of all LI children (367,000) were not LEP and were also not living in an immigrant household. In contrast, almost 700,000 children fell into all 3 categories. In total, about 2.3 million children were in one at-risk group/category only. Excluding all double counting, the three at-risk populations combined account for over 4 million children, or more than 9 percent of the total school age population.

Table II.4: Overlap of School Age Children in Immigrant or LI Households, and LEP Children, Special Tabulation of Census Data, 1990

At-risk population	Number of school age children aged 5-17	Percent of all LEP children^a	Percent of all immigrant children	Percent of all LI children
Immigrant children only	1,113,650		48.0	
LEP children only	875,484	37.9		
LI children only	366,735			21.2
Immigrant/LEP children only	297,561	12.9	12.8	
Immigrant/LI children only	221,981		9.6	12.9
LEP/LI children only	451,479	19.5		26.1
LEP/LI/ immigrant children only	686,634	29.7	29.6	39.8
Total children in all seven at-risk categories	4,013,524			
Children in 1 at-risk category only	2,355,869			

Note: School age children are defined as persons aged 5 to 17 living in families.

^aOur tabulation found 2,319,826 school age children living in immigrant households, 1,726,829 children living in LI households, and 2,311,158 LEP children in 1990.

¹⁴At-risk populations are those who, while not necessarily poor, face significant obstacles to achieving academic success. The at-risk groups discussed are not exclusive; there may be other populations—for example, children in single-parent households—that could also be considered as at-risk but whom we do not include here.

GAO Analysis of 25 Largest Cities

The tabulation contains detailed information on counties and metropolitan areas but not cities. Thus, we analyzed detailed data for the 39 counties the Census identified as containing a part or all of the 25 largest cities as determined by their total population in 1990 (see table II.5). For some cities, such as New York or San Francisco, the county or counties are exactly contiguous with the city's boundaries. For other cities, such as Detroit (Wayne County) or Cleveland (Cuyahoga County), the counties contain other jurisdictions besides the city. For some cities, such as Chicago, most of the city is within one county (Cook), although parts of it are also in other counties.

Table II.5: Census Designations of Counties Containing 25 Largest Cities in Total Population in 1990, Special Tabulation of Census Data, 1990

City	Counties
New York City	Bronx, Kings, New York, Queens, Richmond
Los Angeles	Los Angeles
Chicago	Cook, Dupage ^a
Houston	Fort Bend, Harris, Montgomery ^a
Philadelphia	Philadelphia
San Diego	San Diego
Detroit	Wayne
Dallas City	Collin, Dallas, Denton, Kaufman, Rockwall ^a
Phoenix	Maricopa
San Antonio	Bexar
San Jose	Santa Clara
Baltimore	Baltimore
Indianapolis	Marion
San Francisco	San Francisco
Jacksonville	Duval
Columbus	Fairfield, Franklin ^a
Milwaukee	Milwaukee, Washington, Waukesha ^a
Memphis	Shelby
Washington, D.C.	Washington, D.C.
Boston	Suffolk
Seattle	King
El Paso	El Paso
Cleveland	Cuyahoga
New Orleans	Orleans Parish
Nashville	Davidson

^aMost of the city is located in one county: Chicago is in Cook, Houston is in Harris, Dallas is in Dallas, Milwaukee is in Milwaukee, and Columbus is in Franklin.

Estimated Net Undercount of the 1990 Decennial Census

The decennial census typically fails to count a proportion of the population, and, because our estimates are based on Census data, they are also affected by the undercount. Census has studied certain aspects of the 1990 census' net undercount¹⁵ through its 1990 Post Enumeration Survey (PES), which interviewed a sample of 165,000 census respondents several months after the census. Census also studied the 1990 undercount through demographic analysis—a development of an independent estimate of the population obtained administratively through the use of birth and death record data. Census' demographic analysis forms an historical series profiling the undercount population begun in 1940 and continued through 1990.

For the 1990 census, both the PES and Census' demographic analysis showed a net undercount. The net undercount as estimated by PES was about 1.6 percent of the resident census count of 248.7 million, or approximately 4.2 million people. Based on Census' demographic analysis, the net undercount was 1.85 percent, or approximately 4.7 million persons.¹⁶

Census' PES was geared toward developing undercount estimates for regions, census divisions, and cities and does not directly provide national undercount estimates. The PES also was limited in that it estimated net undercounts for selected age strata, for example, persons from birth to 9 years old and aged 10 to 19.

Census' demographic analysis focused on the variation in the net undercount by age, race, and sex at the national level. Although estimates of the net undercount have declined for each decennial census since 1940, the undercount estimate for 1990 showed a significant increase for males compared to 1980. There is evidence that the net undercount in 1990 varied by race, sex, and age. Analysis by Census researchers suggests that the net undercount was largest for blacks and particularly for black males of ages 25 to 45.¹⁷ The net undercount was also large for black children under age 10, although it approached zero for black males and females aged 15 to 19. Estimated net undercounts for nonblack males and females

¹⁵The undercount is net because, while the census misses some persons, it improperly counts others.

¹⁶About three-quarters of the omissions, or 3.48 million persons, were males. About 40 percent of all omissions or, 1.84 million persons, were black.

¹⁷Although one can infer net undercount estimates of 5 percent for Hispanics from the PES, Census' demographic analysis provides no undercount estimates for Hispanics. Neither the PES nor the demographic analysis examines variation in the net undercount by family income.

were typically much lower than for blacks and approached 0 for persons aged 10 to 14.

Revising our estimates for uncounted black school age children increases the total school age poverty rate. Using data provided us by Census regarding the estimated net undercount of all black children aged 5 to 17, we corrected the 1990 census' estimated national school age poverty rate.¹⁸ Incorporating the net black school age undercount increases the numerator and denominator of the total poverty rate for school age children, increasing the poverty rate from about 17.07 percent to 17.18 percent.

Sampling Errors

Because the tabulation is based on the 1980 and 1990 Decennial Census Sample Edited Detail Files, which contain a sample of individual population records, each reported estimate has an associated sampling error. The size of the sampling error reflects the precision of the estimate; the smaller the error, the more precise the estimate. Sampling errors for estimates from the tabulation were calculated at the 95-percent confidence level. This means that the chances are about 19 out of 20 that the actual number or percentage being estimated falls within the range defined by our estimate, plus or minus the sampling errors. For example, if we estimated that 30 percent of a group has a particular characteristic and the sampling error is 1 percentage point, there is a 95-percent chance that the actual percentage is between 29 and 31.

Generally, the sampling errors for characteristics of national and many state groups did not exceed 1 percent of the estimate at the 95-percent confidence level. However, for some combined characteristics of populations in states with smaller populations—for example, the number of immigrant school age children in families below the poverty level in Vermont—the sampling errors were significantly greater. Because of the sampling error's size relative to the estimate, we did not report estimated differences between 1980 and 1990 whenever the base population was smaller than 5,000.

¹⁸In performing this calculation, we assumed that the net undercount estimate of 4.83 percent for black children aged 5 to 17 was the same as that for non-Hispanic black children. We also assumed that the undercounted black children have the same poverty rate as that for the counted non-Hispanic black children. For nonblack children aged 5 to 17, the estimated net undercount was 1.14 percent.

(Table notes on next page)

**Appendix IV
Detailed Tables on the Characteristics of
School Age Children**

Note: School age immigrant children are defined as those children aged 5 to 17 who are foreign born or living in a family where the mother is foreign born and immigrated to the United States during the previous 10 years. See appendix II. The school age poverty population is defined as the number of persons aged 5 to 17 living in families with incomes below the poverty level.

^a"Other Southeast Asian nations" includes Brunei; Burma; Cambodia; Laos; Indochina; Singapore; Malaysia; Thailand; Indonesia; Singapore; and Southeast Asia, not specified.

^b"Other Middle Eastern nations" includes Bahrain; Cyprus; Gaza Strip; Iraq; Iraq-Saudi neutral zone; Jordan; Kuwait; Lebanon; Mesopotamia, not specified; Middle East, not specified; Oman; Palestine; Persian Gulf States, not specified; Qatar; Saudi Arabia; Syria; United Arab Emirates; West Bank; People's Democratic Republic of Yemen; and Yemen Arab Republic.

^c"Other Asian nations" includes Turkey, Iran, Afghanistan, and nations not classified elsewhere.

^d"Russia/former Soviet Union" excludes the Baltic States.

^e"Eastern Europe" includes Albania; the Baltic States; Bulgaria; Czechoslovakia; Eastern Europe, not specified; Estonia; Hungary; Latvia; Lithuania; Poland; Romania; and Yugoslavia.

^f"Other European nations" includes Austria, the former East Germany, and all other European nations not classified.

^g"North Africa" includes Algeria; Egypt; Libya; Morocco; North Africa, not specified; Tunisia; and Western Sahara.

^h"Other African nations" includes all other African nations not classified elsewhere.

ⁱ"All other nations" includes Australia, Oceania, and all nations not classified elsewhere.

Table IV.7: Change in LEP School Age Population, by State, 1980-90

State	LEP children		Change, 1980-90	
	1980	1990	Number	Percent
Alabama	3,800	7,908	4,108	108.1
Alaska	4,506	4,012	(494)	-11.0
